November 2026

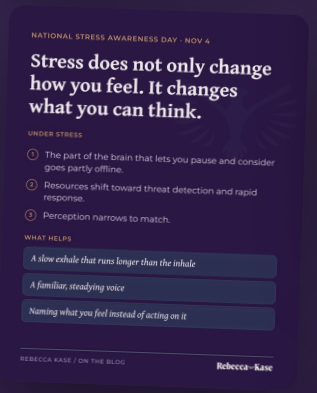

A month of ready-to-post content, built from your own essays: every post designed, every caption written for each platform, and a clear day and time for each one.

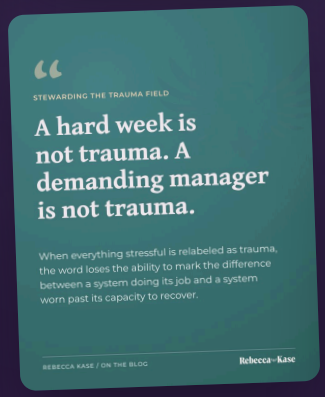

21	9	4	8
POSTS	CAROUSELS	SINGLE IMAGES	REELS

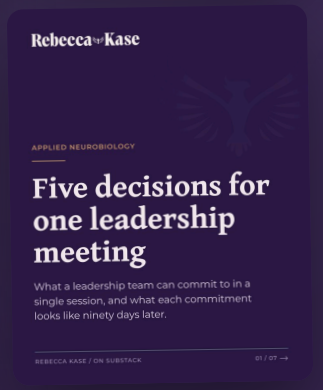

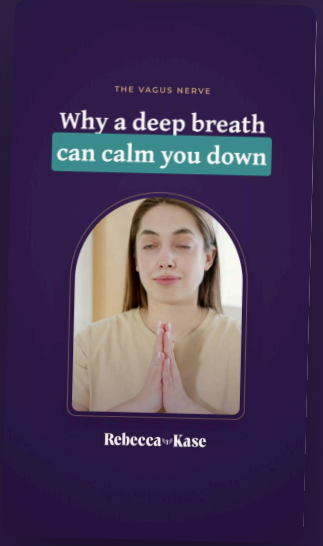

Five posts a week · Monday to Friday · November 2 to 30

The month at a glance

21	9	4	8	2
posts on Instagram, LinkedIn and Facebook	carousels, with a PDF version for LinkedIn	single-image posts	reels, each with a designed cover	new profile headers, for LinkedIn and Facebook

WEEKLY THEMES

Nov 2–6

Stress and the thinking brain

What stress, threat and uncertainty do to how teams think, and what leaders can say when they do not have answers yet. Opens with National Stress Awareness Day.

Nov 9–13

The leader in the room

The mood a leader carries in, saying no without guilt, how to read a room, and why psychological safety is not a policy.

Nov 16–20

Neuro-Informed Living

The five principles, small daily routines, a note for clinicians, the vagus nerve and eight questions on originality.

Nov 23–27

Thanksgiving and 2027 planning

The hour after a hard conversation, a first look at the retreat, a holiday note, gratitude and five decisions for 2027.

Nov 30

Speaking in 2027

The five keynotes, laid out for event planners.

KEY DATES

Wed, Nov 4	National Stress Awareness Day
Wed–Thu, Nov 25–26	Thanksgiving
Late November	Teams and event planners map out 2027

CONTENT PILLARS

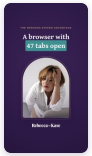

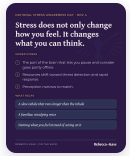

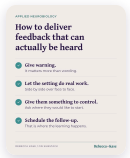

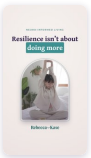

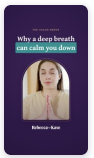

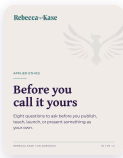

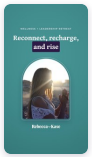

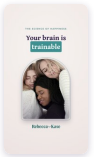

Leadership	7
Neuro-Informed Living	8
Feedback and hard conversations	2
Speaking and retreats	2
For clinicians	2

HOW TO USE THIS PLAN

- **Times** are Eastern, with Pacific alongside, matched to when your recent posts went out. Shift them to your busiest hours in Instagram Insights.
- **Carousels:** upload the PNGs in numbered order on Instagram and Facebook. On LinkedIn, upload the PDF as a document so nothing gets cropped.
- **Links:** Instagram points to the link in bio. LinkedIn links go in the first comment. Facebook captions include the full link.
- **Alt text** is written for every post (Instagram: Advanced settings, then Accessibility).
- **Files:** every post has its own dated folder with the images, the LinkedIn PDF and a captions file ready to copy.

How your grid will look

Every reel gets a designed cover and every post follows the same system, so the profile reads as one calm, consistent body of work.

Mid-month, after November 16

End of the month, after November 30

WHAT STAYS CONSISTENT

- Your plum, blush and teal, with gold and teal labels
- Your winged wordmark on every cover
- The same serif headlines and clear, easy-to-read body text
- A designed cover on every reel, in your caption style
- A closing slide that tells people where to go next

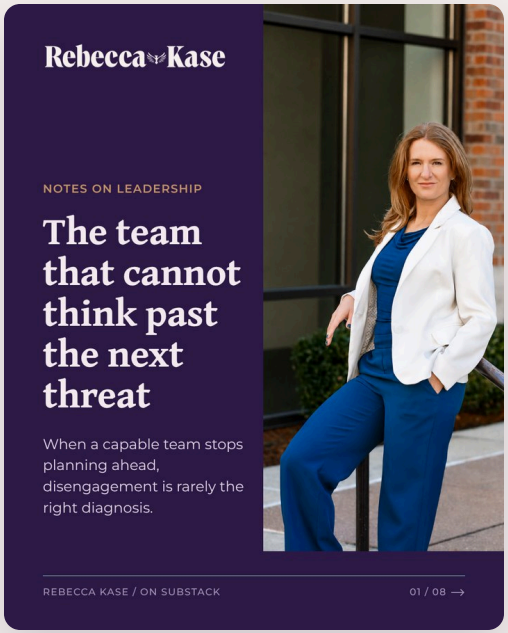

WHERE EACH POST SENDS PEOPLE

- Substack: 7 posts
- Your blog: 9 posts
- Speaking: 1 post
- Free executive brief: 1 post
- Corporate Programs, the retreat waitlist and the Monthly Insights newsletter: 1 post each

INSTAGRAM CAPTION

A team that can't think past Friday hasn't necessarily checked out.

When an environment keeps flagging threat, attention follows. Stress pulls resources toward vigilance and away from planning and judgment, and states spread around a table largely below awareness.

Call the quiet disengagement, and the usual tools follow: pressure, scrutiny, a pointed performance conversation. Each one arrives as one more threat signal.

The more useful question is not who has checked out. It is what the environment, leader included, keeps teaching every nervous system in the room to track.

Have you watched a team's planning horizon shrink? What helped it lengthen again?

ALT TEXT

An eight-slide carousel titled "The team that cannot think past the next threat," with a portrait of Rebecca Kase on the cover. It explains why a team under sustained threat stops planning ahead, why pressure makes it worse, and three ways a leader can change what the room is reading.

LINKEDIN POST

The third reorganization is different.

The senior colleague who could always be relied on to push back on a bad plan now nods along. The team that once argued productively about next quarter cannot seem to think past Friday. Nobody has quit.

Disengagement is the word that comes to mind, but it is not the right one. The system is not checked out. It is recalibrating, budgeting for threat.

Erno Hermans and colleagues have shown that acute stress pulls the brain's resources toward vigilance and away from the executive network that does planning and judgment. Holding a complex plan, weighing a long-term tradeoff, disagreeing well: these are among the first things a threatened brain sets down. And as Sigal Barsade's work shows, states move between people in a group largely below awareness.

That changes the remedy. If the problem were disengagement, the fix would be motivational. If it is a captured switch, the fix is environmental, and the leader is a large part of the environment.

Be a more predictable signal than the reorganization.
Make it safe to raise a problem rather than costly.
Refuse to be one more source of threat.

What helped the last team you watched get its horizon back?

The full essay is on my Substack. Link in the first comment.

A browser with 47 tabs open

Reel | 3:00 PM ET · 12:00 PM PT | For: Entrepreneurs and leaders

REEL

About 57 sec. Real video clips with a calm narrated voiceover, word-by-word captions in your style, original music, and a closing portrait of you.

ON-SCREEN SCRIPT

0–11s	"Picture this. It's 2 PM on a Tuesday." Three cups of coffee, and a brain running on dial-up.
11–15s	"Your brain feels like a browser with 47 tabs open." A browser fills with tabs until it shakes.
15–26s	"What if your nervous system, not your willpower, is actually the CEO of your productivity?" It takes the CEO seat on an org chart.
26–36s	"Bouncing between sympathetic overdrive and dorsal shutdown," rarely hitting the sweet spot.
37–47s	The 60-second reset: a countdown ring and three check-ins. Holding tension? Breathing shallow? Feeling rushed?
47–52s	"You stop fighting for focus, and start accessing it naturally." The 47 tabs close down to one.
52–57s	End: your portrait, "Stop fighting for focus." and "Read the full article".

BUILT FROM

Blog article: "The Nervous System Advantage for Entrepreneurs"

INSTAGRAM CAPTION

Picture this: It's 2 PM on a Tuesday. You've had three cups of coffee, and yet your brain feels like it's running on dial-up internet from 1999.

We've been sold this myth that working harder equals working better. But what if your nervous system, not your willpower, is actually the CEO of your productivity?

Most of us are bouncing between sympathetic overdrive and dorsal shutdown all day long, rarely hitting that sweet spot where real productivity lives.

Try the 60-second reset: every hour, take one minute to check in with your nervous system. Are you holding tension? Breathing shallow? Feeling rushed?

What does 2 PM usually feel like for you?

Read the full article on my blog through the link in my bio.

ALT TEXT

A short video with voiceover. A woman at her laptop at 2 PM, a browser that fills with 47 tabs, and an org chart that puts the nervous system in the CEO seat, followed by a 60-second reset with three check-in questions. It ends on a portrait of Rebecca Kase.

LINKEDIN POST

Your brain feels like a browser with 47 tabs open. You keep "trying harder" to concentrate, but it's like trying to force a key that doesn't fit.

Here's the thing everyone gets wrong about productivity. We've been sold this myth that working harder equals working better. That if you're not grinding 12-hour days and wearing exhaustion like a badge of honor, you're somehow not committed enough.

Your autonomic nervous system is your body's background software, running 24/7, and it has different modes that dramatically affect how well you can think, focus, and perform. In the ventral vagal sweet spot, your prefrontal cortex, the CEO of your brain, is online. In chronic sympathetic activation, you feel wired but not focused, busy but not effective.

Working with your nervous system isn't about adding more to your plate. It's about making small shifts that create big changes, like a 60-second reset every hour: Are you holding tension? Breathing shallow? Feeling rushed?

What would change in your week if focus came from regulation instead of willpower?

The full article, "The Nervous System Advantage for Entrepreneurs," is on my website. Link in the first comment.

National Stress Awareness Day: what stress does to the way you think

Single image | 12:00 PM ET · 9:00 AM PT | For: Everyone | National Stress Awareness Day

INSTAGRAM CAPTION

Stress does not only change how you feel. It changes what you can think.

Under stress, the brain shifts resources toward a network tuned for threat detection and away from the one that supports reflection and flexible attention. The part of you that pauses, weighs consequences, and takes another person's view is, in effect, taken partly offline at the precise moment you'd most like to use it.

That isn't an excuse. It's closer to a map. If you know the narrowing is coming, you can recognize the state while you're still inside it, and give your brain one practiced cue that widens the view again: a slow exhale that runs longer than the inhale, the steadying effect of a familiar voice, a few seconds spent naming what you feel.

It's National Stress Awareness Day. What's the cue that brings you back?

Read "What Stress Actually Does to the Way You Think" on my blog through the link in my bio.

ALT TEXT

A graphic for National Stress Awareness Day, November 4. Headline: "Stress does not only change how you feel. It changes what you can think." It lists what happens under stress and three cues that help: a slow exhale that runs longer than the inhale, a familiar steadying voice, and naming what you feel instead of acting on it.

LINKEDIN POST

You are eleven minutes behind before the day has decided what it wants from you.

None of it is catastrophic. All of it accumulates. And by the time you walk through your own front door, a small and ordinary question lands like an accusation, and you hear yourself answer someone you love in a tone you would never choose on a calmer afternoon.

Stress does not only change how you feel. It changes what you can think.

Amy Arnsten has shown that even mild and uncontrollable stress rapidly weakens the prefrontal cortex, the region that lets you pause and consider. Erno Hermans and colleagues describe how acute stress shifts resources toward a salience network tuned for threat detection. Perception narrows to match.

Regulation is a skill, not a personality trait. The cues that move the body back toward clearer thinking can be practiced: a slow exhale that runs longer than the inhale, the steadying effect of a familiar voice, a few seconds spent naming what you feel instead of acting on it.

It's National Stress Awareness Day. What's one cue that brings you back to yourself?

BUILT FROM

Blog article: "Polyvagal Theory: Understanding Your Nervous System for Better Trauma Recovery"

INSTAGRAM CAPTION

It's like having an overly sensitive smoke detector that goes off at the slightest hint of smoke, even when there's no fire.

When you experience trauma, your brain learns to detect danger more quickly, sometimes too quickly. A loud noise, a certain tone of voice, or even a particular facial expression might send your system into fight, flight, or freeze mode, even when there's no actual danger present.

Your reactions aren't "crazy" or "weak." They're normal neurological responses designed to keep you safe.

By understanding how your nervous system works, you can begin to retrain it: name your state, address safety first, send safety signals, and be patient.

What's one small step you could take today to send safety signals to your nervous system?

A short video with voiceover. A radar scan speeds up, a toaster sets off a smoke alarm with no fire, and three everyday triggers appear: a loud noise, a tone of voice and a facial expression. Four steps follow: name your state, address safety first, send safety signals, be patient. It ends on a portrait of Rebecca Kase.

LINKEDIN POST

Have you ever wondered why your body seems to have a mind of its own during stressful situations? Maybe you've experienced that moment when words fail you during an important presentation, or noticed how quickly your heart races when faced with conflict.

These reactions aren't random. They are part of an intricate system that has been protecting humans since our earliest days.

Dr. Stephen Porges coined the term "neuroception" to describe how your nervous system evaluates risk without conscious awareness. After trauma, it can be like having an overly sensitive smoke detector that goes off at the slightest hint of smoke, even when there's no fire.

By understanding how your nervous system works, you can begin to retrain it. Name your state. Address safety first. Send safety signals. Be patient. Small, regular practices are more effective than occasional intensive efforts.

Where do you notice your own smoke detector going off?

2 3 4 5

6 7 8

INSTAGRAM CAPTION

You do not need certainty to create predictability.

When the honest answer is that you don't know yet, the structure around that answer is what people can work with.

Swipe for the practical version:
Reassurance and information are not the same thing.
Sort what you know into three piles.
Give a date for the next update, not the decision.
Name the limits of your knowledge without filling them.
Say "I don't know" in a way that holds.
Check your own state before you speak.

It is less than people want. It is much more than silence.

Which of these is hardest for you in practice?

Save this for the next time you are holding news you can't share yet, and find the full post on my Substack through the link in my bio.

ALT TEXT

An eight-slide carousel titled "What to say when you do not have the answer yet." It covers the difference between reassurance and information, sorting what you know into three piles, giving a date for the next update, naming the limits of what you know, saying "I don't know" in a way that holds, and checking your own state.

LINKEDIN POST

What do you actually say when the honest answer is that you don't know yet?

"Everything is going to be okay" is reassurance. It asks people to trust your read of a situation they cannot see. "We don't know yet, and here is what happens next" is information. Reassurance tends to age badly. Information ages well, even when the news is bad.

The practical version:

1. Sort what you know into three piles: what has been decided, what has not been decided, and what is still being worked through, and by whom. The first list is usually longer than you think.
2. Give a date for the next communication, not the decision. "I will be back to you on the fifteenth, whether or not there is news."
3. Name the limits of your knowledge without filling them. A clearly labeled unknown is workable. An unknown decorated to look like a known is not.
4. Say "I don't know" in a way that holds: here is what I do know, here is what is being worked on, here is when you will hear from me next.
5. Check your own state before you speak. People forecast from your bracing as much as from your words.

When you cannot reduce uncertainty, reduce the unpredictability around it. It is less than people want. It is much more than silence.

Which of these do you find hardest to do?

The full post is on my Substack. Link in the first comment.

The mood walks in first

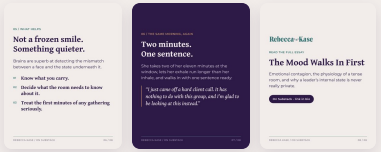

Carousel · 8 slides | 12:00 PM ET · 9:00 AM PT | For: Leaders

SLIDE 1 · COVER

2 3 4 5

6 7 8

INSTAGRAM CAPTION

The mood walks in before the leader says a word.

In a meeting, every brain in the room is quietly forecasting what the situation will cost. Faces, posture, and tone are the data. And because attention follows status, the leader's signal carries the most weight.

This isn't an argument for the frozen smile. Brains are superb at detecting the mismatch between a face and the state underneath it.

It's an argument for something quieter: knowing what you carry, deciding what the room needs to know about it, and treating the first minutes of any gathering with the seriousness their influence deserves.

What do you do in the minutes before you walk into a room?

Read the full essay, "The Mood Walks In First," and subscribe to my Substack through the link in my bio.

Use the Instagram caption, ending with "Read the full essay, "The Mood Walks In First," on my Substack: https://rebeccakase.substack.com/p/the-mood-walks-in-first" and the hashtags #Leadership #Neuroscience #WorkplaceCulture.

ALT TEXT

An eight-slide carousel titled "The mood walks in first," with a portrait of Rebecca Kase on the cover. The slides explain how a leader's mood spreads through a meeting, drawing on research by Sigal Barsade and Thomas Sy, and close with what helps: know what you carry, decide what the room needs to know about it, and treat the first minutes of any gathering seriously.

LINKEDIN POST

She had eleven minutes between a hard client call and a product review.

She said nothing about the call. She took her seat, opened her notebook, and said, "Let's get started."

By the second slide, the room had changed. The engineer presenting began to talk faster. A designer decided this was the wrong day to raise her concern.

If you had asked anyone afterward, they would have described the product discussion. It is unlikely that anyone would have mentioned her face.

But in a meeting, every brain is continuously sampling faces, posture, and vocal tone to forecast what the situation will cost. Attention follows status, so the leader's signal carries the most weight. When Thomas Sy and his colleagues shifted a leader's mood before a group task, the mood transferred to the team and shaped its coordination and effort.

A leader's internal state is organizational information, whether or not she ever discloses it.

That isn't an argument for the frozen smile. It's an argument for knowing what you carry, deciding what the room needs to know about it, and treating the first minutes of any gathering with the seriousness their influence deserves.

What do you do in the minutes before you walk into a room?

I wrote about this in "The Mood Walks In First" on Substack. The link is in the first comment.

Blog article: "Mindful Boundaries: Protecting Your Energy Through a Polyvagal Lens"

INSTAGRAM CAPTION

That tightness in your chest when your boss emails at 9 PM? That's not anxiety. It's your nervous system waving a giant red flag, screaming that your boundaries are about to get trampled.

Your body knows you need to set that boundary before your brain catches up.

Every yes you don't mean is energy borrowed from your future self, and that debt comes with brutal interest rates in the form of exhaustion and resentment.

Before responding to a request, take three slow breaths, extending your exhale. Then ask yourself: "Does this feel like a yes in my body, or am I saying yes from fear?"

Protecting your energy by saying no isn't selfish. It's a nervous system regulation strategy.

Which request would you answer differently after three slow breaths?

ALT TEXT

A short video with voiceover. A late-night email lights up a phone, a red veil streams in the wind like a giant red flag, and a future-self battery drains with every yes. A breath ring guides three slow breaths. It ends on a portrait of Rebecca Kase.

LINKEDIN POST

Here's something nobody tells you about saying "no": your body knows you need to set that boundary before your brain catches up.

That tightness in your chest when your boss emails at 9 PM? That's not anxiety. It's your nervous system waving a giant red flag.

The science behind why we struggle with boundaries isn't about willpower or personality flaws. It's about biology, specifically polyvagal theory, which explains how our autonomic nervous system responds to safety and threat.

Think of it this way: every yes you don't mean is energy borrowed from your future self, and that debt comes with brutal interest rates in the form of exhaustion and resentment.

Before you answer, take three slow breaths, extending your exhale (5-count inhale, 7-count exhale). Then ask: "Does this feel like a yes in my body, or am I saying yes from fear?"

Protecting your energy by saying no isn't selfish. It's a nervous system regulation strategy.

What's one yes you would take back this week?

How to deliver feedback that can actually be heard

Single image | 12:00 PM ET · 9:00 AM PT | For: Leaders

INSTAGRAM CAPTION

Most feedback preparation goes into wording. The physiology says wording is the wrong variable.

By the time your first carefully chosen sentence lands, the other person's body has already formed its prediction about what this conversation will cost. Four things change that:

1. Give warning. A short note naming the topic and the time lets the anticipatory work happen ahead of the meeting, not in the ninety seconds when they most need to think.
2. Let the setting do real work. Side by side over face to face. A space they already know.
3. Give them something to control. Ask where they'd like to start. Invite their account first. Don't require agreement in the room.
4. Schedule the follow-up. The first conversation is mostly for delivering. The second is mostly for processing.

None of it makes the message easier to hear in the moment it arrives. It protects the capacity that will be needed to hear it afterward.

Save this for your next hard conversation. The full post is on my Substack, link in bio.

#Feedback #Leadership #Neuroscience #PsychologicalSafety #RebeccaKase

FACEBOOK

Use the Instagram caption, ending with "Read the full post on my Substack: https://rebeccakase.substack.com/p/how-to-deliver-feedback-that-can" and the hashtags #Feedback #Leadership #Neuroscience.

ALT TEXT

A checklist graphic titled "How to deliver feedback that can actually be heard," with four steps: give warning, because it matters more than wording; let the setting do real work, side by side over face to face; give them something to control; and schedule the follow-up, because that is where the learning happens.

LINKEDIN POST

If you spend your preparation time on wording, you may be working on the wrong variable.

The body's evaluation of a feedback conversation completes before the content has been processed. So most of what decides whether feedback lands has already happened before the first carefully chosen word is spoken.

What the physiology implies for practice:

1. Warning matters more than wording. A short advance note naming the topic, the time, and the fact that it is a conversation rather than a verdict moves the anticipation out of the moment.
2. The setting does real work. Side by side over face to face. A walk, if the relationship allows it. Slow your pace, and sit down before you begin.
3. Give them something to control. Amy Arnsten's research shows the impairment is produced most reliably by stress that feels uncontrollable. Ask where they would like to start. Invite their account before you give yours. Do not require agreement in the room.
4. The follow-up is where the learning happens. Schedule it two or three days out, to hear what they took from it, what they disagree with, and what they need.

None of it makes the message easier to hear in the moment. It protects the capacity that will be needed to hear it afterward.

Which of these is missing most often where you work?

Psychological safety is not a policy

Reel | 3:00 PM ET · 12:00 PM PT | For: Leaders and HR

REEL

About 52 sec. Real video clips with a calm narrated voiceover, word-by-word captions in your style, original music, and a closing portrait of you.

ON-SCREEN SCRIPT

0–6s	"Psychological safety is a nervous system state. Not a policy." A policy document gets stamped.
6–19s	"The right language in the values statement. The right policies in the handbook." No policy can produce that state on its own.
20–27s	"Identifiable through a constellation of embodied markers."
27–37s	Real team moments tick off: eye contact, modulated voices, laughter, comfortable silence.
37–41s	"A dysregulated leader cannot produce a regulated team." A jagged signal over a tense meeting.
42–47s	"The body is the medium through which leadership is actually transmitted." The signal settles into a calm wave.
47–52s	End: your portrait, "Partner with Rebecca Kase & Co." and "Corporate Programs".

BUILT FROM

Blog article: "Psychological Safety Is a Nervous System State, Not a Policy" and your Corporate Programs page

INSTAGRAM CAPTION

Psychological safety is a nervous system state, not a policy.

The right language in the values statement, the right policies in the handbook, the right declared commitments from leadership: no policy, however carefully written, can produce that state on its own.

When it is real, you can see it. People make eye contact. Voices are modulated rather than flat. There is laughter. Silence is comfortable enough that people use it.

A dysregulated leader cannot produce a regulated team. The body is the medium through which leadership is actually transmitted.

What's the first sign of real safety you look for in a room?

Partner with Rebecca Kase & Co. to bring this work to your organization. Link in my bio.

ALT TEXT

A short video with voiceover. A psychological safety policy is stamped "not a policy," then real team moments tick off eye contact, modulated voices, laughter and comfortable silence. A jagged signal over a tense meeting settles into a calm wave. It ends on a portrait of Rebecca Kase and "Partner with Rebecca Kase & Co."

LINKEDIN POST

Psychological safety has been treated as a property of organizational culture that can be installed through the right inputs: the right language in the values statement, the right policies in the handbook, the right declared commitments from leadership.

What the neurobiology suggests is that it belongs to a different category altogether. It is an autonomic state, established and sustained through ongoing co-regulation between nervous systems, and no policy, however carefully written, can produce that state on its own.

When it is real, it is identifiable through a constellation of embodied markers. People make eye contact. Voices are modulated rather than flat. There is laughter. Silence is comfortable enough that people use it.

Which means a leader's most important contribution is not the policies they write but the state they bring into the room. A dysregulated leader cannot produce a regulated team. This is a competence, and it can be developed.

What would change if your leadership team owned psychological safety the way it owns strategy?

Rebecca Kase & Co. brings trauma-informed, resilience-focused programs to organizations, from custom trainings to consulting services. Details in the first comment.

INSTAGRAM CAPTION

Asking yourself whether a room feels tense gives you an answer colored by your own state. Asking about specific markers gives you data you can act on.

Four things to track when you walk into a team that isn't telling you the truth yet:
1. The markers, not the mood.
2. Your own budget, before anyone else's.
3. The thirty seconds after disagreement.
4. Repair, as the intervention rather than the apology.

The early sign it's working is rarely enthusiasm. It's usually someone finishing a sentence they would previously have abandoned.

Which of these do you already do without thinking about it?

ALT TEXT

A seven-slide carousel titled "Reading a room before you try to change it," covering four things to track: observable markers rather than mood, your own state first, the thirty seconds after disagreement, and repair as the intervention. It ends with the early signal that it is working: someone finishing a sentence they would previously have abandoned.

LINKEDIN POST

Asking yourself whether a room feels tense produces an answer contaminated by your own state. Asking about specific, observable markers produces data you can act on.

Four things to track when you walk into a team that is not telling you the truth yet:

1. Track the markers, not the mood. Whether people look at each other or only at whoever is speaking. Whether silence gets used or nervously filled. Whether people finish their own sentences.
2. Check your own budget before you read anyone else's. A depleted reader reads threat that is not there, and a leader who reads threat that is not there behaves in ways that create it.
3. Watch the thirty seconds after disagreement, not the disagreement itself. That is where the room tells you what disagreeing costs.
4. Treat repair as the intervention, not the apology. Name the specific behavior. Do it in the room, or as close to it as you can.

The early signal that it's working is rarely enthusiasm. It is usually someone finishing a sentence they would previously have abandoned.

This one is written for clinicians moving into leadership and for leaders who want to use their nervous system literacy more precisely. Which of the four comes most naturally to you?

The full post is on my Substack. Link in the first comment.

INSTAGRAM CAPTION

What if we designed our lives around how humans actually work?

That question sits at the center of everything I teach, write, research, and build. For generations, we've tried to understand people primarily through behavior, symptoms, and performance. But those are only the visible expression of something much deeper.

These are the five principles of Neuro-Informed Living:
People make sense.
Biology before judgment.
Safety changes what is possible.
Healing is about creating conditions.
Human flourishing is designed.

Which one do you need most this week?

If you'd like more of this, my Monthly Insights newsletter is linked in my bio.

An eight-slide carousel titled "The principles that guide everything I do," with a photo of Rebecca Kase on the cover. Each slide presents one of the five principles of Neuro-Informed Living: people make sense; biology before judgment; safety changes what is possible; healing is about creating conditions; and human flourishing is designed.

LINKEDIN POST

What if we designed our lives around how humans actually work?

That question sits at the center of everything I teach, write, research, and build. For generations, we've tried to understand people primarily through behavior, symptoms, and performance. Those are only the visible expression of something much deeper.

When we understand biology, relationships, environment, and context, people begin to make sense. That is the lens I bring to every stage, classroom, organization, and conversation, and it comes down to five principles:

1. People make sense.
2. Biology before judgment.
3. Safety changes what is possible.
4. Healing is about creating conditions.
5. Human flourishing is designed.

Understanding how humans actually work doesn't just change how we treat trauma. It changes how we lead, learn, parent, build organizations, and live.

Which principle shows up most in your work right now?

Resilience isn’t about doing more

Reel | 3:00 PM ET · 12:00 PM PT | For: Everyone

REEL

About 48 sec. Real video clips with a calm narrated voiceover, word-by-word captions in your style, original music, and a closing portrait of you.

ON-SCREEN SCRIPT

0–9s	“Resilience isn’t about doing more. It’s about doing small things consistently that keep your nervous system out of the red zone.” A sun-to-moon dial starts the day.
9–17s	Morning: “Start with sensation before screen.” “Stack one tiny nervous-system practice onto an existing habit.”
17–25s	“Create space between waking and working.” “Move your body in some way that feels good, not punishing.”
25–34s	Evening: “Create a transition ritual between work and rest.” “Move gently to help your system discharge the day’s stress.”
35–38s	Bedtime: “Check in with your nervous system before sleep.” Seven teal beads complete the day.
38–43s	“Start small. Build slowly. Trust the process.”
43–48s	End: your portrait, “Start small. Build slowly.” and “Read the full article”.

BUILT FROM

Blog article: “Building Resilient Routines: A Day in the Life of a Regulated Practice Owner”

INSTAGRAM CAPTION

Resilience isn’t about doing more. It’s about doing small things consistently that keep your nervous system out of the red zone.

Start with sensation before screen. Stack one tiny nervous-system practice onto an existing habit. Create space between waking and working. Move your body in some way that feels good, not punishing. Create a transition ritual between work and rest. Move gently to help your system discharge the day’s stress. Check in with your nervous system before sleep.

The key isn’t doing all of these perfectly. It’s choosing one or two that feel doable and stacking them onto habits you already have.

Which one could you start this week?

Start small. Build slowly. Trust the process. Read the full article on my blog through the link in my bio.

ALT TEXT

A short video with voiceover. A sun-to-moon dial moves across a day as seven small nervous-system practices drop onto it, from sensation before screen in the morning to a check-in before sleep. It ends on a portrait of Rebecca Kase.

LINKEDIN POST

Resilience isn’t about doing more.

Here’s what I’ve learned after years of building, burning out, rebuilding, and finally figuring out what actually works: it’s about doing small things consistently that keep your nervous system out of the red zone.

A practical framework you can adapt, from morning to night: start with sensation before screen, stack one tiny nervous-system practice onto an existing habit, create space between waking and working, create a transition ritual between work and rest, and check in with your nervous system before sleep.

The key isn’t doing all of these perfectly. It’s choosing one or two that feel doable and stacking them onto habits you already have. Research shows it takes anywhere from 18 to 254 days to form a habit, with an average around 66 days.

Start small. Build slowly. Trust the process.

What’s the first small practice in your day?

“A hard week is not trauma.”

Single image | 12:00 PM ET · 9:00 AM PT | For: Clinicians

INSTAGRAM CAPTION

A hard week is not trauma. A demanding manager is not trauma.

The spread of trauma language has done real good. It has reduced shame and sent more people toward help. But when the word keeps traveling and the science stays behind, it expands to cover almost any difficulty, and it flattens into something simpler and more marketable than the research supports.

The distinction matters. Ordinary stress, the kind that resolves, is part of how a healthy system stays calibrated. Trauma names something specific: durable effects that register in functioning, in relationships, and in the body’s regulation of itself over time.

Gatekeeping asks who is allowed in. Stewardship asks what the thing is for.

For clinicians and educators: how do you keep the language accessible without letting it come loose from the science?

Read “When Trauma Becomes a Brand” on my blog through the link in my bio.

#TraumaInformedCare #Therapists #Neuroscience #MentalHealth #RebeccaKase

LINKEDIN POST

A hard week is not trauma. A demanding manager is not trauma.

A decade ago, the phrase “trauma-informed” lived almost entirely inside clinical training rooms. It has since appeared on the homepage of productivity apps, in the copy for weekend retreats, across corporate leadership decks, and, at least once that I have seen, on the label of a candle.

I want to be careful here, because the easy move is contempt, and contempt is not analysis. The spread of this language has done real good. It has reduced shame and sent more people toward help.

But when everything stressful is relabeled as trauma, the word loses the ability to mark the difference between a system doing its job and a system worn past its capacity to recover.

And a space is not made safe by announcing that it is trauma-informed. Safety is built over time, through how people are actually treated.

Gatekeeping asks who is allowed in. Stewardship asks what the thing is for.

For those of us who train clinicians: how do you keep this language accessible without letting it come loose from the science?

I wrote about this in “When Trauma Becomes a Brand.” Link in the first comment.

Why a deep breath can calm you down

Reel | 3:00 PM ET · 12:00 PM PT | For: Everyone

REEL

About 57 sec. Real video clips with a calm narrated voiceover, word-by-word captions in your style, original music, and a closing portrait of you.

ON-SCREEN SCRIPT

0–7s	"Have you ever wondered why taking a deep breath can instantly calm you down?" "The vagus nerve."
7–18s	"Often called the wandering nerve." A glowing body map lights the brain, heart, lungs and digestive tract.
18–28s	"80 to 90 percent of the nerve fibers carry information from your gut to your brain. Not the other way around."
29–34s	"You can actually train and strengthen your vagus nerve, similar to training a muscle." A vagal tone meter fills.
34–44s	Five ways: cold exposure, rhythmic breathing, humming and singing, connection and co-regulation, meditation and mindfulness.
45–51s	"With consistent attention and practice, you can build greater resilience, one breath at a time."
51–57s	End: your portrait, "One breath at a time." and "Read the full article".

BUILT FROM

Blog article: "The Role of the Vagus Nerve in Self-Regulation and Emotional Resilience"

INSTAGRAM CAPTION

Have you ever wondered why taking a deep breath can instantly calm you down? The answer lies in a fascinating neural superhighway running through your body: the vagus nerve.

Often called the "wandering nerve" because it meanders throughout your body, it connects your brain to major organs including your heart, lungs, and digestive tract. Approximately 80 to 90% of its nerve fibers carry information from your gut to your brain, not the other way around.

The good news is that you can actually train and strengthen your vagus nerve, similar to training a muscle: cold exposure, breathing practices, humming and singing, social connection, and meditation.

With consistent attention and practice, you can build greater resilience and emotional regulation, one breath at a time.

Which of these do you already do without realizing it?

Read the full article on my blog through the link in my bio. For more vagus nerve-calming practices, see my book, The Polyvagal Solution.

ALT TEXT

A short video with voiceover. A glowing line drawing of the vagus nerve winds through the body, lighting the brain, heart, lungs and gut, with signals flowing up from gut to brain. Five ways to train it follow. It ends on a portrait of Rebecca Kase.

LINKEDIN POST

Have you ever wondered why taking a deep breath can instantly calm you down? Or why your stomach knots up when you're anxious?

The answer lies in the vagus nerve, often called the "wandering nerve" because it meanders throughout your body. It's like the body's built-in stress management system, connecting your brain to major organs including your heart, lungs, and digestive tract.

When you're stressed, your sympathetic nervous system kicks into high gear. Your vagus nerve acts as the brake pedal, helping to slow your heart rate and bring your body back to a calm state.

You can actually train and strengthen your vagus nerve, similar to training a muscle. Five evidence-based places to start: cold exposure, breathing practices, humming and singing, social connection, and meditation.

Your nervous system is remarkably adaptive. With consistent attention and practice, you can build greater resilience and emotional regulation, one breath at a time.

Which of these fits most easily into your workday?

The full article, "The Role of the Vagus Nerve in Self-Regulation and Emotional Resilience," is on my website. Link in the first comment. For more vagus nerve-calming practices, see my book, The Polyvagal Solution.

Before anything goes out under your name, run eight questions. Write the answers down; the act of writing tends to surface sources that a mental check does not.

This is for people who make things: clinicians developing a training, leaders building a team or a company, writers, educators, founders. It assumes you're acting in good faith. That's exactly why the questions are necessary, since sincere people routinely misremember other people's ideas as their own.

Attribution does not shrink your contribution. It makes your contribution legible.

Which of the eight is the hardest one for you to answer honestly?

Save this, and read the full post, plus the essay behind it, "On Non-Stealing," on my Substack through the link in my bio.

ALT TEXT

A seven-slide carousel titled "Before you call it yours," with eight questions to ask before you publish, teach, launch, or present something as your own, three honest options when the answers are uncomfortable, and a note for clinicians to teach models with the names attached.

LINKEDIN POST

Would you be comfortable publicly describing the full lineage of what you have built?

Not the version for the website. The complete version, to the people who would know whether it was complete.

That's the last of eight questions I'd ask before anything goes out under your name: a training, a program, a framework, a book, a company. The research on cryptomnesia is clear that sincere people routinely misremember other people's ideas as their own, which is exactly why good faith isn't enough on its own.

When the answers are uncomfortable, there are three honest options: add the attribution, do more of your own thinking before you ship, or decide not to build this one yet.

For leaders, the habit is simple and rare: say in the room where an idea came from, including when it came from someone junior to you or someone who has since left. It builds a culture in which people are willing to offer ideas, because they know they will be credited for them.

Attribution does not shrink your contribution. It makes your contribution legible.

All eight questions are in the full post. Link in the first comment.

The hour after a hard conversation

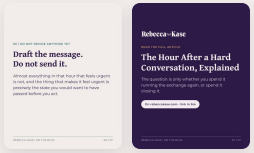

Carousel · 7 slides | 12:00 PM ET · 9:00 AM PT | For: Everyone

SLIDE 1 · COVER

2 3 4 5

6 7

INSTAGRAM CAPTION

The conversation is over. Your physiology has not been told.

Most advice about hard conversations stops at the door. But the hour afterward is where most of the damage gets done: to your afternoon, to your judgment, and sometimes to the relationship itself, when you send the follow-up message you'll want back by three.

Four things worth doing with that hour:
Move, before you think.
Change where you are standing.
Write it down once.
Do not decide anything yet.

If a hard conversation is on your calendar this Thanksgiving week, which of these will you reach for first?

Read the full article on my blog through the link in my bio.

FACEBOOK

Use the Instagram caption, ending with "Read the full article on my blog: https://www.rebeccakase.com/blog/hour-after-a-hard-conversation" and the hashtags #NervousSystem #Neuroscience #EmotionalRegulation.

ALT TEXT

A seven-slide carousel titled "The hour after a hard conversation," with a photo of Rebecca Kase outdoors on the cover. It explains why the hour after a difficult conversation matters and lists four things to do with it: move before you think, change where you are standing, write it down once, and do not decide anything yet.

LINKEDIN POST

The meeting ends at eleven. Someone says something about circling back, the call drops, and you are sitting in a room that is suddenly very quiet.

None of the next hour is reachable, because you are already back at minute nine, running the exchange again.

Most advice about difficult conversations stops at the door. But the hour afterward is where most of the damage gets done: to your afternoon, to your judgment, and sometimes to the relationship itself, when you send the follow-up message that you will want back by three.

Jos Brosschot and colleagues described how a stressor lasts minutes, while rumination can sustain the physiological response for hours or days. Replaying the conversation is, in physiological terms, close to having it again.

Four things worth doing with the hour:

1. Move, before you think. Fifteen minutes outside is not nothing.
2. Change where you are standing. Look at what happened as if you were a third person watching it.
3. Write it down once. Fifteen minutes, unedited, not for anyone.
4. Do not decide anything yet. Draft the message if you need to. Do not send it.

What do you usually do in the hour after a hard conversation?

The full article is on my website. Link in the first comment.

INSTAGRAM CAPTION

Happy Thanksgiving. A small practice for today: write down three specific things you're grateful for. This literally rewires your brain to notice positive experiences.

Your brain is trainable. It literally rewires itself based on where you focus your attention.

Think of your brain as a high-tech bar mixing up "cocktails" of neurotransmitters. Dopamine fuels motivation and anticipation. Oxytocin, the "connection hormone," strengthens bonds within teams or families. Serotonin and endorphins keep mood steady and boost resilience.

And we're hardwired to thrive with social support.

What are your three today?

A short video with voiceover. A neon sign reading The Brain Bar flickers on and a glass fills layer by layer with dopamine, oxytocin, serotonin and endorphins, ending on a glowing neural network and a portrait of Rebecca Kase.

LINKEDIN POST

Happy Thanksgiving.

What if happiness wasn't just luck or mindset, but a product of real brain science?

Happiness is more than a feeling. It's a series of brain events working behind the scenes, and your brain is trainable. It literally rewires itself based on where you focus your attention.

Three brain-based habits worth trying today. Write down three specific things you're grateful for. Have at least one meaningful conversation; your oxytocin levels will thank you. Acknowledge small victories; your dopamine system needs regular positive feedback.

Happiness isn't a luxury for leaders. It's essential fuel for high performance and sustainable success.

What are you grateful for this year?

Five decisions for one leadership meeting

Carousel · 7 slides | 12:00 PM ET · 9:00 AM PT | For: Leaders

SLIDE 1 · COVER

2 3 4 5 6 7

INSTAGRAM CAPTION

Five decisions for leaving your next leadership meeting with something decided rather than something discussed. Each is small enough to make in one session and concrete enough to check in ninety days:

1. Name the owner.
2. Set the capacity number and the stacking rule.
3. Add two questions to every promotion decision.
4. Fund consultation for leaders as a standing cost.
5. Pick three behavioral measures and report them alongside the numbers.

Taken together, they move regulation from the wellness portfolio to the leadership portfolio, which is the whole point.

If your team is planning 2027, which one would you put on the agenda first?

Save this for your next leadership meeting. The full post is on my Substack, and my free executive brief, "Why High-Performing Teams Break Down," is linked in my bio.

A seven-slide carousel titled "Five decisions for one leadership meeting." Each slide names one decision and what it looks like ninety days later: name the owner, set the capacity number and the stacking rule, add two questions to every promotion decision, fund consultation for leaders, and pick three behavioral measures. The last slide shows the free executive brief.

LINKEDIN POST

If your leadership team is planning 2027, here are five decisions small enough to make in one meeting and concrete enough to check in ninety days.

1. Name the owner. One executive, by name, owns the organization's regulatory capacity. Not HR, not a committee.
2. Set the capacity number and the stacking rule. Eighty-five percent is a reasonable starting point; the number matters less than having one. And the hour after a consequential decision is not booked.
3. Add two questions to every promotion decision. What happens in this person's rooms in the thirty seconds after someone disagrees with them? And do the most capable people who have reported to them stay?
4. Fund consultation for leaders as a standing cost, budgeted like a license or a professional membership.
5. Pick three behavioral measures and report them alongside the financial numbers.

If the leadership team has not done it to its own calendar, nobody else will. And if the measures have produced nothing uncomfortable, they are probably the wrong measures.

Which of the five would be hardest for your team?

The full post is on my Substack, and my free executive brief, "Why High-Performing Teams Break Down," is on my website. Both links are in the first comment.

If you're planning 2027 events, these are my five keynote topics:

1. Stewarding the Future of Trauma Care
2. Wired to Lead
3. Advancing Clinical Practice
4. Building Thriving Cultures
5. Peak Performance & Human Flourishing

Each one is grounded in neuroscience, rooted in real-world experience, and tailored to the audience in the room, from clinical conferences to executive teams.

Swipe to see who each talk is built for.

Tap the link in my bio to bring one to your event.

An eight-slide carousel titled "Keynotes for 2027," with a photo of Rebecca Kase speaking to a conference audience on the cover. One slide for each of her five keynotes and who it is ideal for, then "Informative. Engaging. Immediately applicable." and an invitation to bring Rebecca to your event.

LINKEDIN POST

If you're planning conferences, leadership summits, or professional development for 2027, these are the five keynotes I offer:

1. Stewarding the Future of Trauma Care, for clinical conferences, healthcare organizations, professional associations, and training institutes.
2. Wired to Lead, for leadership summits, executive teams, women's leadership events, and professional development.
3. Advancing Clinical Practice, for mental health professionals, clinical conferences, CE providers, and treatment centers.
4. Building Thriving Cultures, for organizations, HR and people teams, culture and well-being initiatives, and change management.
5. Peak Performance & Human Flourishing, for high-performance teams, sales and performance groups, well-being programs, and education.

Every presentation is grounded in neuroscience, rooted in real-world experience, and tailored to the audience, in person or virtually.

If one of these fits an event you're planning, I'd love to hear about it.

Speaking details are in the first comment.
